Concept:
recBooker is a app and website that helps eliminate the common problem associated when individuals or sports team rent a sport field or party gazebo only to find when they arrive at their assigned time there is already someone using the field or gazebo. This creates an awkward situation where the party that rented the facility has to confront the party using the facility to ask them to leave. Recbooker can help lessen or solve this issue by presenting information that confirms the rental of the facility by the correct party.

Features:
> **Front End:**

>> **Entry Interface:** There will be an entry interface which allows the operator to "book" a facility for a particular party on a set day and time frame. The interface will also allow you to update and delete the entry if needed.

>> **Facility Chooser Interface:** This interface will display all of the facilities as individual buttons. When the user chooses a facility the screen will go to a separate URL where we pass the :facilityName to the API to display the information on the people who rented the facility.

>> **Facility Display Screen:** This screen will allow the user to choose a date and will then display the information of all of the parties that have rented that facility for that chosen day.

Technologies:
> **Javascript**
> **Express**
> **Sequelize**
> **Handlebars**
> **Bootstrap**
